## **Claims**

We claim:

1. A method for detecting an unusual event in a video, comprising: 1 extracting motion vectors from each frame in a video; determine zero run-length parameters for each frame from the motion vectors;

summing the zero run-length parameters over predetermined time intervals of the video;

determining a distance between the sum of the zero run-lengths of a current time interval and the sum of the zero run-lengths of a previous time interval;

signalling the unusual event if the distance is greater than a predetermined threshold.

- 2. The method of claim 1 wherein the zero run-length parameters are classified into 1
- short, medium and long zero run-lengths. 2
- 3. The method of claim 2 wherein the zero run-length parameters are normalized 4 with respect to a width of each frame of the video. 5

6

3

10

- 4. The method of claim 2 wherein short zero run-lengths are defined to be one third
- 2 the width of the frame or less, medium zero run-lengths are greater than one third
- 3 and less than two thirds of the width of the frame, and long zero run-lengths are
- 4 equal to or greater than the width of the frame.
- 4. The method of claim 1 wherein the zero run-length parameters express the
- 2 number, size, and shape of distinct moving objects in the video.
- 5. The method of claim 2 wherein the distance is an absolute difference of the short run-lengths sums.
  - 6. The method of claim 2 wherein the distance is a difference of squares of the short and long zero run-lengths.
  - 7. The method of claim 1 wherein the video is of a scene without moving objects, and the unusual event is a moving object entering the scene in the video.
  - 8. The method of claim 1 wherein the video is of a scene including vehicle traffic
- 2 on a highway, and the unusual event is stalled traffic.
- 1 9. The method of claim 1 wherein the stalled traffic is due to an out-of-scene
- 2 accident.
- 1 10. The method of claim 1 wherein the unusual event is inferred but not directly
- 2 observed.

1	11. The method of claim 1 further comprising:
2	detecting the unusual event in a real-time video.
1	12. A system for detecting an unusual event in a video, comprising:
2	a camera acquiring a video of a scene;
3	means for extracting motion vectors from each frame in the video;
4	means for determine zero run-length parameters for each frame from the
5	motion vectors;
6	means for summing the zero run-length parameters over predetermined time
6 -7 -8 -9	intervals of the video;
8	means for determining a distance between the sum of the zero run-lengths of
9	a current time interval and the sum of the zero run-lengths of a previous time
0	interval; and
1	an alarm device for signalling the unusual event if the distance is greater
-1  -2	than a predetermined threshold.
9-19
